Reservations and materials

QUICK GUIDE / SECTION 01

Book a printer

Reserve a printer through the lab calendar at least 24 hours before your slot. Each reservation covers one printer for up to two hours. Check in with the supervisor when you arrive.

Bring approved filament

The lab accepts PLA and PETG. Use the material profile that matches your spool. ABS is excluded from the open work area because its ventilation is designed for PLA and PETG.

Prepare your file

Export the model as an STL and bring the file on a USB drive. The slicer on the workstation shows an estimated print time. If it exceeds your slot, split the job or book a longer supervised session.

Cooling and cleanup

QUICK GUIDE / SECTION 02

Wait before removal

After a print finishes, let the build plate cool to 35 degrees Celsius before removing the part. Check the plate temperature on the printer display. Use the flexible plate to release the print.

Sort the waste

Put clean scraps in the bin marked with the matching material. Keep paper, tape, and adhesive out of the filament bins. Brush the work surface clean before leaving the station.

Report a failed print

Stop the job from the control panel if the model detaches from the plate. Leave the hot end alone and report the problem to the supervisor. Record the printer number and filament type in the log.
